# Final Website Revisions

## General

### Navigation bar width

I had an issue on mobile devices with the navigation bar getting chopped off on the side.

To fix this, I got rid of the flex-basis in the navigation bar's flex box.

### Sticky navigation bar

I used JavaScript and CSS styling to create a "sticky" navbar effect when scrolling down.

### Text

I had a complaint that "your website is in a different language" because I was using Lorem Ipsum filler text while I figured out the design I wanted to use.

I added text related to the pages' content to fill each page with meaningful and realistic text to match.

### Page images

I added images on the pages "Home," "Courses," "Apply," and "Resources" after feedback from the survey requesting the use of more visuals.

## Home

### White space above image

Originally, I had added white space to the top of this image as I felt it provided something beneficial visually, but after consideration chose to remove this space.

I felt that removing this space gave the page less visual clutter.

### Spacing below introduction

I decided to switch the location of the video on the home page, and after doing so felt there was a greater need to divide the space at the top of the page.

To address this, I added a horizontal line ("<hr>") with styling and space before and after.

```
<hr style="width: 70%; color: #ccc; margin-top: 30px;">
```

## Resources page

Originally, I wanted to add a calendar page using a table. But after considering how I could use skills from this class in my website, I decided to add an information accordion of commonly used information.

### Accordion

I used JavaScript and CSS to create the accordion as seen on the "Resources" page.
